

TFEB Break Apart FISH Probe Kit

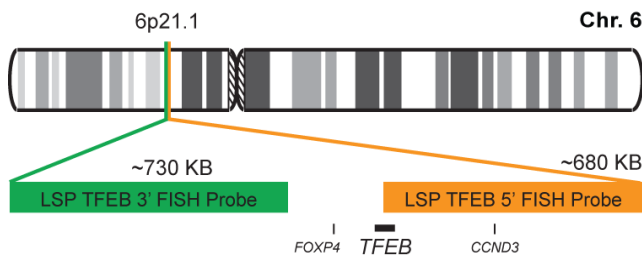

Introduction

The TFEB Break Apart FISH Probe Kit is designed to detect rearrangements in the human *TFEB* gene located on chromosome band 6p21.1. In addition to revealing breaks, which can lead to translocation of parts of the gene, inversion, or its fusion to other genes, the probe set can also be used to identify other *TFEB* aberrations such as deletions or amplifications. Rearrangements and abnormal expression of the *TFEB* gene – also known as *TCL1* – have been observed in renal cell carcinoma and other tumor types.

Intended Use
To detect rearrangements in the human <i>TFEB</i> gene located on chromosome band 6p21.1.

Probe Design

LSP TFEB 5' FISH Probe covers the 5' (start) portion of the *TFEB* gene and some adjacent genomic sequences. LSP TFEB 3' FISH Probe covers sequences downstream (3' end) of the gene. The two probes are flanking sequences across the *TFEB* gene in which various breakpoints have been observed.

Not to Scale

Cat. No.	Volume
